

Sod Care

- Water 1-3 hours per sprinkler setting, depending on weather and soil conditions
- Mow when leaf growth reaches 3-4"
- Lawn fertilizer available at our Garden Center can be applied 30 days after installation
- See watering and mowing calendar (right)

One can reduce lawn maintenance and a lot of hassle by selecting the right grass seed mix. In some instances, you might have two or even three different seed mixes in your lawn; and sometimes it is best to admit defeat and plant ground covers or hosta. A few things to consider include: the level of maintenance, the intensity of shade and the amount of wear or use the turf will receive.

Watering Sod

Newly installed sod should not dry out; it must be watered immediately after installation. Pay special attention to watering sod edges, as they will dry faster. Deep, thorough watering encourages deep root systems, which will eventually require less maintenance. Water 1-3 hours per sprinkler setting or position (see chart).

Week 1								Mow
Week 2								Water
Week 3
